

Liquidity Sweep Trader V3 - Step-by-Step Guide

Date: 16-06-2026

Purpose

This dashboard is a replay-first learning system for liquidity sweep trading. It is designed for paper trading and very small live testing only. It does not place trades by itself. The main goal is to help you learn what happened, why the signal appeared, and whether the trade was worth taking.

Uncomfortable rule: with a £100 live test account, the correct risk per trade is about £1. If that feels too small, the issue is not the dashboard - it is the temptation to over-risk.

What the dashboard contains

Screen	What it does
Dashboard	Trade212-style market radar, best setup, signal queue, school-run mode.
Replay Centre	Graphical replay of the level, sweep, reversal, entry and outcome.
Trade Ticket	Shows system instruction, evidence, entry, stop, target, risk and reward.
Journal	Saves your TAKE/PASS decisions locally in your browser.
IBKR Setup	Explains the safe connection path from dashboard to local Python bridge to IBKR.
Settings	Account size, risk per trade and daily loss limits.

How to open the app locally

1. Download the ZIP file.
2. Right-click and extract/unzip it.
3. Open the extracted folder.
4. Double-click index.html.
5. The app opens in your browser. No installation is needed.

How to use the daily workflow

1. Open Dashboard. Look at the market radar only. Do not start with charts.
2. If a setup is green, click it and open Replay Centre.
3. Press Play. Watch the sequence: level -> sweep -> back inside range -> entry -> outcome.
4. Read the plain-English explanation on the right.
5. Open Trade Ticket. Check entry, stop, target and risk.
6. Choose TAKE or PASS. In early use, this should be a paper decision.
7. At the end of the day, open Journal and review whether you followed the rule.

School Run Mode

The app is designed around the fact that you may be away during the early US session. The scanner concept records what happened. When you return, you review the replay instead of chasing a missed entry. The rule is simple: if the trade already moved too far, do not take it. Use it as a learning replay only.

IBKR Connection - Safe Setup Path

Important: this static GitHub Pages app cannot connect directly to Interactive Brokers. IBKR access runs through Trader Workstation or IB Gateway on your own computer. The safe architecture is:

Layer	Role
GitHub Pages dashboard	Displays replay, trade ticket and journal.
Local Python bridge	Runs on your PC and talks to IBKR API.
IBKR TWS or IB Gateway	Provides market data and paper/live account access.
Paper account	First testing environment.
Live account	Only after 100-200 logged trades and proven discipline.

IBKR setup steps

1. Install Interactive Brokers Trader Workstation or IB Gateway.
2. Log in to the paper trading account first.
3. In TWS, open Settings / Global Configuration.
4. Go to API -> Settings.
5. Enable ActiveX and Socket Clients.
6. Keep the paper trading port as 7497 unless you deliberately changed it.
7. Install Python on your PC.
8. Open Command Prompt in the dashboard folder.
9. Run: `pip install ib-insync flask flask-cors`
10. Run: `python ibkr_bridge_example.py`
11. Open `http://127.0.0.1:5050/status` in your browser. It should show `connected: true` once TWS is open and API is enabled.
12. Only after this works should the dashboard be extended to read quotes from the local bridge.

Order safety rules

- Do not allow automatic live orders in Version 3.
- Do not trade live during the first few days. Paper trade first.
- With £100 capital, risk £1 per trade and stop after £3 daily loss.
- Do not trade during major economic news until the system has a news filter.
- Do not scale until you have at least 100 logged trades.

Files included

- `index.html` - the dashboard app
- `README.md` - short setup notes
- `ibkr_bridge_example.py` - starter local IBKR bridge template
- `dashboard-v3-guide.pdf` - this guide
